

## **What Happens During The Procedure?**

Once placed inside the peripheral vasculature using a pin-sized entry through the skin, the tiny rotating tip of the ClariVein® catheter is set in motion to treat the inside of the vessel delivering medicine specified by your doctor. The medicine is delivered through the unique rotating tip of the catheter allowing for 360 degree coverage of the vessel.

The procedure typically takes very little time and creates minimal discomfort.

## **What Happens After The Procedure?**

Follow your doctor's instructions for care after your procedure. In some cases rapid return to normal activities can be expected.

- Can be performed in your doctor's office
- Typically takes very little time
- In some procedures, studies have shown up to 74% reduction in pain compared to other minimally-invasive procedures
- Only requires a pin-sized entry through the skin
- Minimal discomfort during procedure
- Rapid return to normal activities

## **ClariVein®**

ClariVein® is a specialty catheter for the infusion of physician specified fluids. Used for multiple applications, the ClariVein® system includes a 360 degree rotating tip allowing for the well dispersed coverage of the vessel. Use of the ClariVein® does NOT require painful anesthesia and will not cause thermal agitation.

**In some procedures, studies show when using ClariVein® patients reported up to 74% less pain and rapid return to normal activities.^**

ClariVein® is indicated for the infusion of physician specified agents in the peripheral vasculature.

[www.ClariVein.com](http://www.ClariVein.com)

### **What is ClariVein®?**

ClariVein® infusion catheter system, is a specialty catheter with a unique rotating dispersion tip. The system promotes controlled, dispersed and effective coverage of a fluid medicine your doctor will choose to treat the peripheral vasculature.

The ClariVein® device is a slim, thin catheter (tube) that your doctor temporarily inserts into the peripheral vasculature through a pin-sized entrance point. ClariVein® is several times smaller than other devices used in peripheral vascular treatments allowing the entrance point to be smaller.

### **Why Choose ClariVein®?**

Procedures which use ClariVein® are often simpler, faster and studies have shown up to 74% less pain than other minimally-invasive peripheral vascular treatments. Because no thermal energy is used, there is no need for the multiple needle-stick injections of anesthesia (pain-numbing) medication along the length of the treated area. This shortens the time the procedure takes, reduces pain and discomfort, and also eliminates bruising.

### **Ask your Doctor if ClariVein® is right for you**

Ask your doctor about the difference the ClariVein® infusion catheter can offer when compared to other available treatments.
